

In order to run & use this app locally:

Clone the repository:

git clone <https://github.com/BiggaHD/Mars-EMS>

Install the necessary dependencies:

Run **NPM install** in all three folders:

- ROOT folder (Mars-EMS).
 - BACKEND folder (Mars-EMS\backend).
 - FRONTEND folder (Mars-EMS\frontend).
-

Add your own credentials:

- Go to <https://console.cloud.google.com>
- Create a new project.
- Enable the **Google Spreadsheets API**.
- Create OAuth credentials - for the client choose **Web client**
- Copy the **Client ID** and paste it inside of the **config** file (frontend\src\config\config.js).
- Don't forget to do similar for the **backend** -Look into the '**client_secret**' JSON file for more info.
- For the backend, you'll have to choose '**Other**' aka Installed.
- Download the file and save inside of the backend (it's root) folder under the name '**client_secret.json**'.

NOTE: Both of them have to point to the same project.

Additionally, if you want to use a remote **MongoDB** storage, you'll have to the **connections.js** file and change your preferences. The file is located inside of the **backend\config\connections.js** file.

Now let's start the project:

Run an instance of your local MongoDB: **mongod** [Important – this needs to start first]

Run the following command inside of the **root** folder: **npm start**

NOTE: It will start the NodeJS backend and the ReactJS frontend at the same time.

It's time to login:

Login is restricted. Currently, there's only one email with approval:

Email: bigga.test.2018@gmail.com

Password: [test_1234](#)

You can edit that list inside of the config file, located in: **frontend\src\config\config.js**

This part is very important:

After you get redirected, copy the code received from Google, go back to localhost: 3000 or Heroku (depending on where you're doing the testing), paste it into your app and confirm.

Deployed version:

To test it online please **visit:** <https://hr-ems.herokuapp.com>

Login with the same email and password provided above, after redirect allow the app the permissions needed [it's my mail anyways :)], copy the code, go back, paste the code, submit and enjoy while testing it. If you want to test the app to its fullest, here are links for the 2 Google sheets used in this app:

- a) [Employee spreadsheet](#) (used to manage employees, their salaries, status, bonuses, penalties, etc.).
- b) [Accountant spreadsheet](#) (used to calculate salaries).
